
Class will start

at 7:05 AM

Agenda

Setup dev env using vite
- State and dynamic UI
- inputs in React: controlled components
- Thought process to create a react components (~~this is the problem that will cause a lot of issues~~)
- Lifting the state up → prop drilling

1. What is the use-case of React

→ babel

a to convert JSX code to html ,css and JS

b to provide component based design and efficiently optimize the UI updates

c a&b

d none of the above

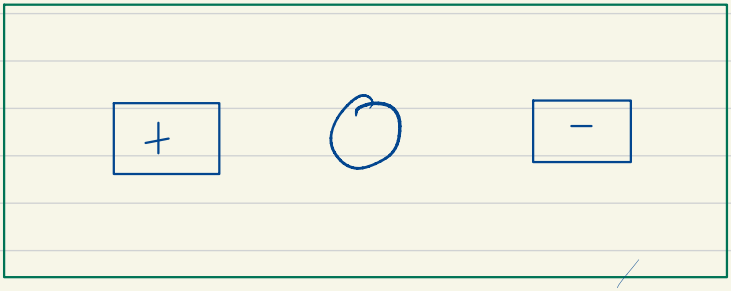
2. Who is responsible for Dom update.

* React
* ReactDOM
* Babel
* CRA

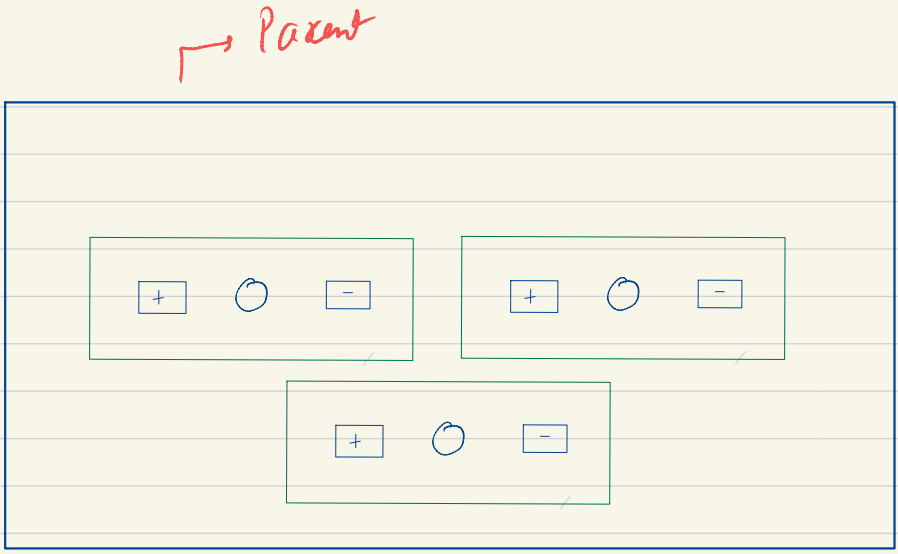
3. Which things is primarily used by parent component to configure children components.

* keys → Performance feature → react can identify all the list elem uniquely
* attributes
* props
* state

Counter

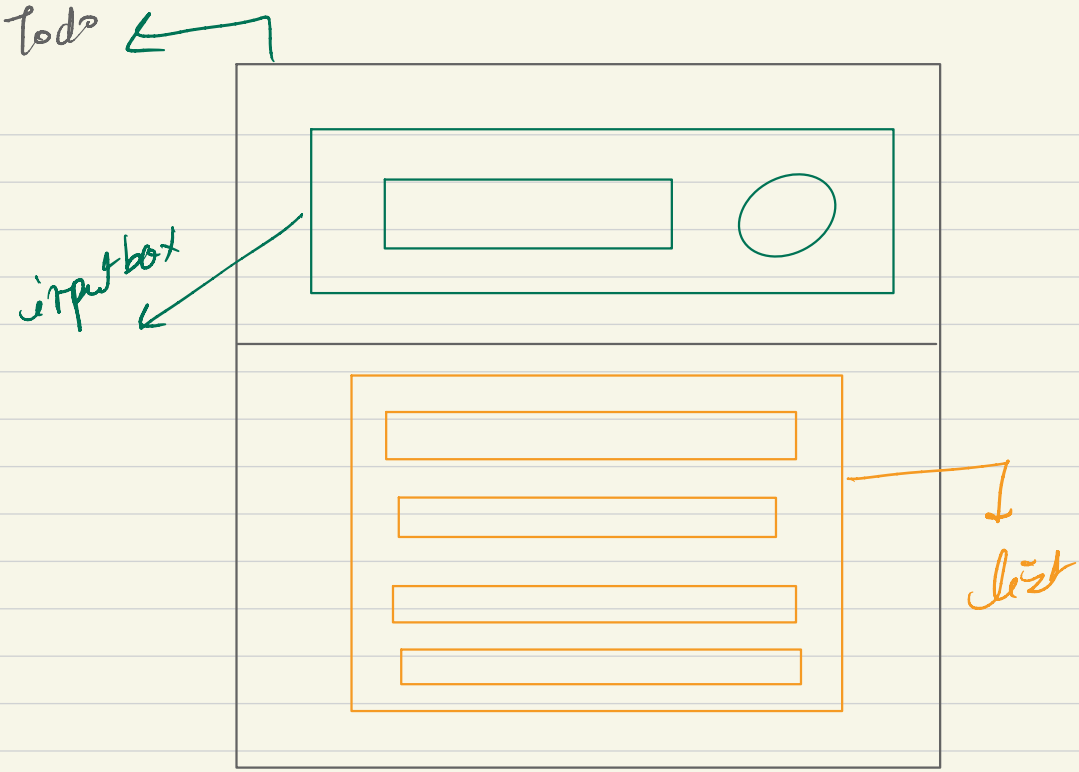


1. write static HTML
2. add EventListener → interaction
3. identify the state var
4. inside → handler fn² update your state

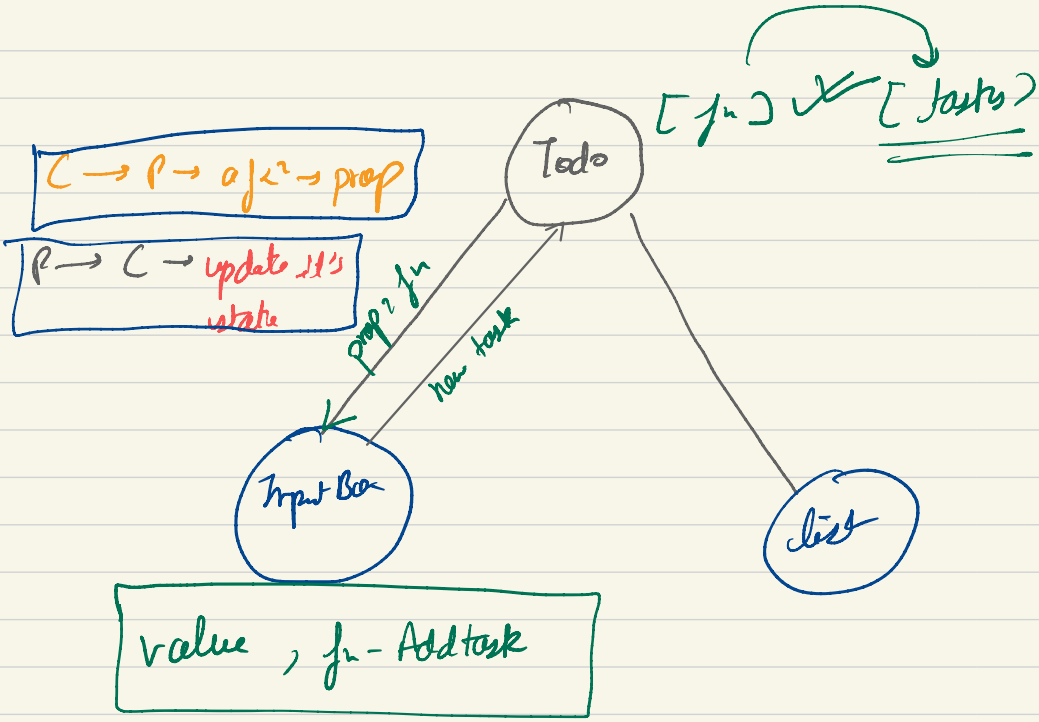


Vite / CRA

- module bundling → single file
- hot-reload
- linter → you follow code standards
- Creating production build



1. write static HTML
2. add EventListener → interaction
3. identify the state var
4. inside → handler fn update your state
5. divide those into multiple components
6. Identify common state and put it to a common ancestor



Re-Render → when state is updated
↳ fx² will execute
↓
descendant → re-rendered
