
Class will start

at 7:05 AM

Agenda

* React DevTools

* component lifecycle
  * Stages: mount , update , unmount

* Intuition for useEffect
  * Real Life problems
  * making an API request → prop drilling

* UseEffect and and it's 6 cases
* Machine coding Problem : stop watch
  * how to save data across re-renders → use-ref
  * recommended way to use useState

1. What is the use-case of React

→ babel

a to convert JSX code to html ,css and JS

b to provide component based design and efficiently optimize the UI updates

c a&b

d none of the above

2. Who is responsible for Dom update.

* React
* ReactDOM
* Babel
* CRA

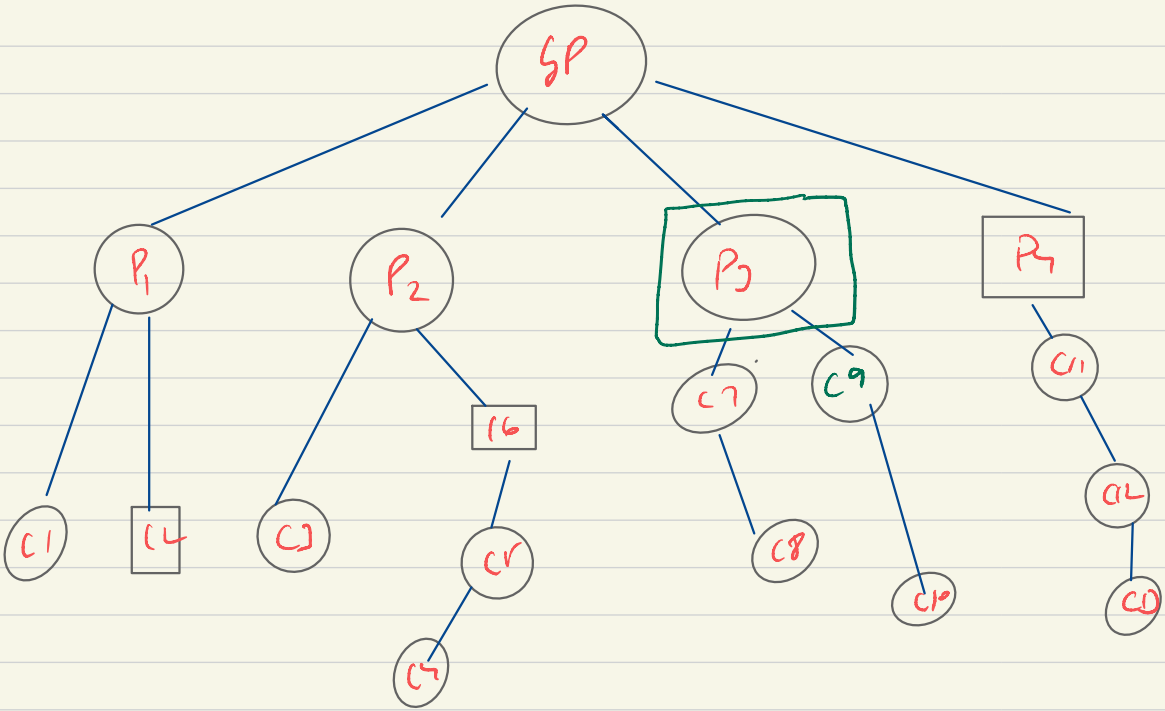
3. Which things is primarily used by parent component to configure children components.

* keys → Performance feature → react can identify all the list elem uniquely
* attributes
* props
* state

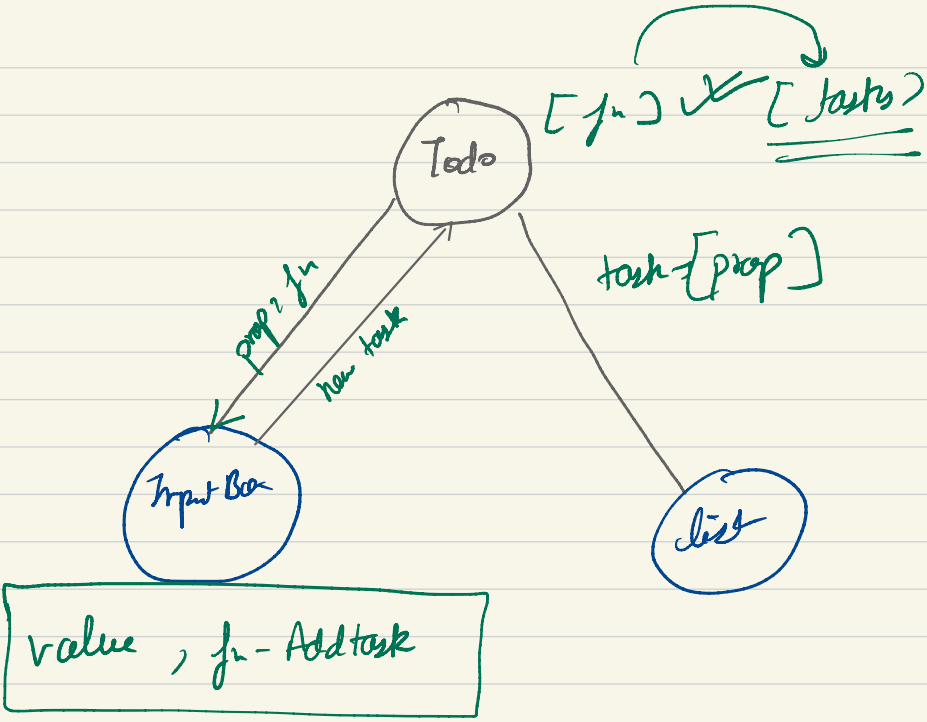
① Component → re-rendered

- → ✓ variable [hoisting]
- → State
- → ✓ function → handler

② What is controlled component ?



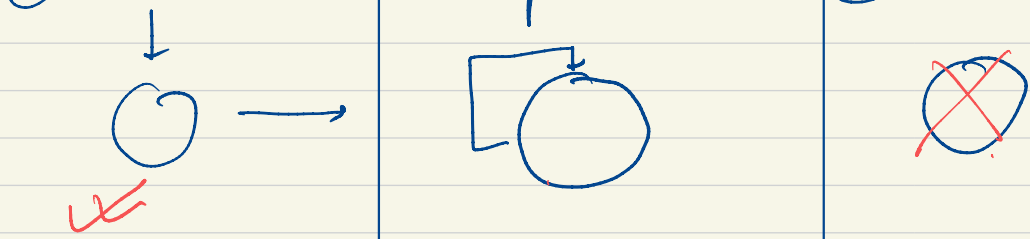
① Lifting the state up



Todo
[fn] [tasks]
task [prop]
prop, fn
new task
Input Box
list
value , fn - Addtask

Components

(mounting)	Updation	Unmounting
① Create	② Update	③ Deletion



→ usestate → a special var → for handling re-rendering of a component

→ useEffect
